

Example of sorting within a PT

and have sorting take the front seat on the next project. Whether you're developing a new financial planning model or working on a large-scale project, you can design better sorting modules within the Pivot Table.

Sorting is an easy process that should be a core part of the Pivot Table strategy. You need to perform secondary actions after you've designed the right Pivot Tables. You can do so by consulting with peers on what sorting activity works best for what datasets relevant to your industry. A reference for Sorting is shared.

How to get the most out of your Pivot Tables

Here are some important pointers to remember to get the most out of your Pivot Tables –

1. It is important to come up with a robust strategy to enhance your Pivot Table. You need to think about the PT from a strategic point so that you can represent the information better. You're also going to be more adept at sharing insights concisely.
2. Leveraging the full scale of features, including filtering, scaling and sorting are important. These professional-level tools allow for greater control over the data and better insight generation overall. You can create a stronger impact when looking at the data from different perspectives.
3. Pivot tables can be used for presentations as well. You may be able to use a pivot table within a sheet to present the data and your findings properly. Since the Pivot table is a dynamically changing element, you can change data points within the table to get dynamic results. **d**
