

When troubleshooting, it's important to review the problem from the eyes of a scientist and not just a data entry expert. You want to find out the root cause behind why the file was corrupted in the first place. You also want to ensure that the problem isn't repeatable and create the appropriate compliances around the area.

If the employee has opened a wrong file type or whether they had a virus, there could be a myriad of reasons outside of the fact that the excel document was broken. It's important to keep all factors into consideration when designing your troubleshooting program.

Investigating the file

You need to investigate the file correctly. There may be errors in the file name or something wrong with the interface itself. While you may not get to know the right answer at first glance, you can perform preliminary tests on the spreadsheet. You can review workflows or understand which formulae were being used.

One of the most common popup errors when using Excel

Investigating the file requires you to think outside the box. You can't rely on the human error being the sole reason why the file refuses to open. There may be other considerations that are still in play even when you open the file in a different server environment. When it comes to investigating, a thorough approach is generally the best one that you can adopt.
