

that bars any third-party apps to be installed. You can also have a more comprehensive implementation in place when you introduce different partners in the domain.

You should also try to open the file on a clean installation on a fresh laptop. That might trigger the file to open without having to review the presence of the third-party. You can also create a more secure environment for your employees by having stronger policies around Excel use.

Third-party apps may even provide backdoor entries for hackers to penetrate the system. This can leave you vulnerable to attacks that can come from any side. It's best to isolate the computer and not have any other files be shared with it until the final solution can be cracked. While you may be able to recover the file, the data may have been corrupted.

Broken formulae and troubleshooting

A bad formula can truly bring the entire file down. That's why the best policy is to ensure that you're making copies when working within the ecosystem. You're also more likely to create a more compliant environment when you set the right example.

Evaluate Formula command being used to double check

The situation is a familiar one, as many files get crashed after running bad formulae. Troubleshooting via the default option is the safest bet. Microsoft has built-in options that allow you to recover your file safely. This works more than 70% of the time, but there are always chances of poor-quality recovery.
