

| DEFAULT SCREENS  |                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------|
| 3D View Full:    | Preview your scene in full screen 3D.                                                                                            |
| Animation:       | Movement of objects, changing shape and colour, and other animation tricks.                                                      |
| Compositing:     | Assemble the whole scene by putting together the different individual parts(background scenes) and filtering(colour correction). |
| Default:         | This layout is used by whenever a new file is created.                                                                           |
| Game Logic:      | As the name suggests, it is for creating games within Blender.                                                                   |
| Motion Tracking: | Used for motion tracking.                                                                                                        |
| Scripting:       | Used for Documentation or writing scripts for automation of Blender.                                                             |
| UV Editing:      | Controls how to texture maps to surface by flattening a projection of an object mesh in 2D.                                      |
| Video Editing:   | Cutting and editing of animation sequences.                                                                                      |

## Save and Override

The blend-file saves the current screen layout. You can use Load UI in the File Browser to use the file's screen layout. It will replace the current layout.

## Areas

The rectangular application window is divided into number of re-sizable areas. An area contains the workspace for a editor. Example: 3D View Editor.

## Arranging

Areas are cleverly arranged in Blender. The large screen is split into smaller non overlapping areas in such a way that each area is fully visible at all times. This makes it easy to switch areas.

### Changing the Size

You can resize areas by dragging their borders with Left Mouse Button. Move the cursor to the border between areas and the cursor will change to a double headed arrow , drag to the desired size.

## Splitting and Joining

### Area Split Widget

The area split widgets are in the upper right and the lower left part of
