

Collapsing and Expanding

The state of the panel is seen on the left of the title : expanded (▼) and collapsed (▶). Left click on the panel title or press A to toggle between expanded and collapsed. If you want to collapse all but current panel, press Ctrl+Left Mouse Button. You can collapse or expand many panels at once by dragging the left mouse button

Position

A grip widget (⋮) is present in the upper right corner. You can change the position of a panel within its region by dragging the widget with the left mouse button click.

Tool Shelf panels. Panel headers are circled.

Pinning

If you want to see panels from different tabs simultaneously, then you can pin the panels. A pinned panel always remains visible irrespective of the tab selected. Right click on the panel you want to pin and select the Pin option

Alignment

To change the alignment of the panels, right click anywhere in the main region of the Properties Editor, select horizontal or vertical. Vertical alignment is usually preferred for the panels.

We mostly talked about the default settings in Blender. We have not yet touched upon one of the greatest strength of Blender - Customisability. Blender is highly customisable and can suit the needs of every user. For a taste of its immense power, go to the **User Preferences...** option in the File tab of the Header section and explore the plethora of customisable objects. You can change shortcuts, adjust sensitivity, add new hotkeys, change the theme and the list goes on. Take a look at these before proceeding to the next chapters. In the following chapters we will get to explore the different facets of Blender in details. **d**
