

A mesh compared to a surface

We can select meshes in several ways in the edit mode. By going into edit mode (press tab) we can choose which selection we want, vertices (default), edges or faces by hotkey ctrl-tab, which gives us options on choosing whichever we want.

Subdivision surfaces

Subdivision surfaces are very useful tools for modelling in Blender. If we select any object and go to the modifiers tab> subdivision surface, we can choose the number of subdivisions we want for a particular mesh either in view (to work with) or in Render. Generally, we can keep the subdivisions in view lesser (like 2) to make the modelling less taxing on the computer but can increase it in render so that the final object looks smooth.

An object with 4 subdivisions in view and 2 in render
