

The Art of Texturing

Let's take a look at all the tools and features in Blender that allow us to bring our 3D models to life.

TEXTURING

Texturing is the next stage in a 3D production pipeline that comes after modelling. A complete 3D model looks dull and lifeless; Textures give life and creates an appeal to the 3D models. Textures work in union with shaders and materials to produce the final result. Shaders modify the underlying image in various ways, changing the colour, adding a gradient, or modifying it over time. Different Texture types are used to control different parts of the shader.
