

The colour sample is the colour reflected after light hits the surface. This is usually kept as white. Intensity controls the amount of glossiness, and the hardness slider controls the hardness and softness of the glow. Check the sample rate as you change these settings to see how it affects and changes appearance.

3) Shading

If you want a surface to glow even in low light adjust the Emit slider. Ambient light allows the object to react as if indirect light were hitting it. There are few more shading settings which are available here.

4) Transparency

Z Transparency is the basic setting available. After checking the transparency box and selecting the Z Transparency, you can control how transparent an object is using the alpha slider.

5) SubSurface Scattering (SSS)

BS is used to improve rendering for materials in which light enters the material through a point and leaves through another point, like our skin.

6) Strands

Strands are used to represent hair or grass when it is used in conjunction with particle systems. With strand settings, you can control the root and tip width of the strand.

7) Shadow

When you don't want an object to receive shadows from objects with transparent materials or ray-tracing, and when you don't want an object to be able to cast shadows these settings come into play and can be adjusted in this panel.

TEXTURING IN BLENDER

The next step after creating a material would be to add tex-
