

tures. Material and texture properties work.

Together. Click on the texture button beside the material button. After you click the “New” button, you have choices in the texture buttons. You have the option to use one of blender’s preloaded textures (which are not often used) or provide your image as a texture. Blender is capable enough to use almost any image file type regardless of the software package used to create it. JPEG images are the most common file types used in texturing due to their low file size and compression capabilities. But most of the studios use file types like PNG, TGA or TIFF as they don’t compromise with image quality though it creates big file size. Blender is even capable of lacing a movie

on an object as a Material. This is a good effect if you want to add animation within your animation. For example, this feature can be used to show television screens or computer monitors within a digital environment. The option you see in the texture panel are as follows:

1) Texture channels

You can add multiple textures to an object through this. For example, If you added a diffuse map for a brick texture, but also want to add a roughness map. You would add both textures here.

2) Texture Name

Naming the textures are done here. It’s a good idea to name your textures. You can also add and delete textures.
