

mastered it. Many people have gone to great lengths to use material shading nodes to achieve realistic effects.

CONCLUSION

The procedures and techniques presented here are only touching the surface of what texturing is. We have discussed about what texturing is, what the different kinds of texture maps are, what are the types of texturing, Difference between materials and shaders, how blender works with materials and texture, how to add materials and textures to objects, how to tweak the properties of materials to obtain different outcomes, how to UV unwrap a model, how displacement maps work within blender and how realistic materials are made using blender by professionals.

We highly suggest you explore further, break down and understand what you have learnt, and eventually come up with different workflows for texturing.
