

Scene 5: A funky design created in Blender rendered in Cycles

Some Funky Effects with Light

Now let's get quirky and try to exploit what we have learnt to create some cool cooling effects. We will use the same hollow cube we had modelled before. Except that this time, instead of just adding the basic ambient, diffuse and specular properties we will add an emission and a gloss property (We had warned you things would only get more and more complex over time). We do this using node:

1. First change the rendering engine to Cycles (Cycles is often more superior to the Blender's inbuilt rendering engine).
2. Now select the "hollow cube" object, and add a material to it.
3. Click the "Use Nodes" button.
4. Now, change the view to "Node Editor" (you can toggle the views with a small dropdown at the bottom left corner).
5. In the Node Editor, you will be able to see two interconnected nodes, a "Diffuse BSDF" node and a "Material Output" nodes. Nodes are at the heart of Blender material modelling, and without it you are like a soldier without a sword.
6. Disconnect the "Diffuse BSDF" node and perhaps delete it (we won't be needing it for this tutorial). You can delete it by pressing the X key.
7. Add a new node from the Node dropdown menu at the bottom. Select Add -> Shader -> Emission.
