

Object Mode: This mode is used for positioning of objects and changing settings for the entire object.

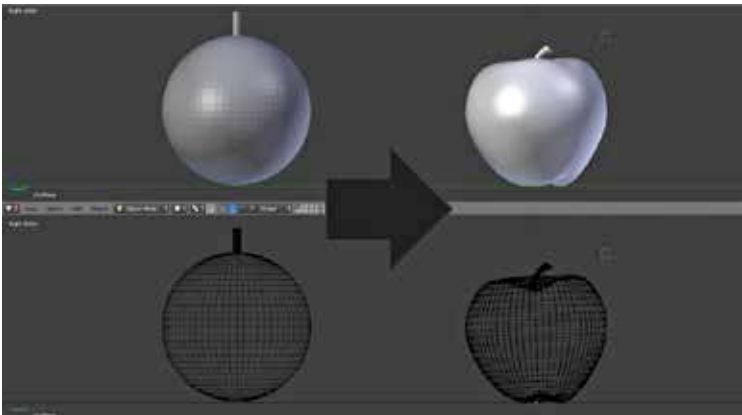

Edit Mode: This mode is used to change the shapes of the meshes in an object.

It will be easier if you could see the sphere while editing it, so select the plane and the cylinder (hold shift while selecting for multiple selections) and press H to hide them. Now, to edit the apple's body, select the UV Sphere. To switch to edit mode, press Tab or select Edit Mode from the menu at the bottom of the screen which reads Object Mode. In the Edit Mode, you will find all edges and vertices of the sphere highlighted (selected). This means we can now edit the object by changing the position of its vertices. But before jumping into modelling right away, let's add a modifier to our sphere.

Modifiers: These do just what their name tells us – They modify the model in one or the other way. Trying out all the different Modifiers is encouraged as covering all of them in this chapter is not feasible.

You will be working with the Subdivision Surface Modifier. It can be found under the Add Modifier option in the Modifiers Tab, in the Tab Headers on the right side of the screen.

Subdivision Surface Modifier: This modifier smoothens the surface by increasing the polygon count and performing an averaging action on the vertices. This modifier is very useful as it allows us to change the shape of the mesh by editing just a few points while still being able to get a high-poly result.

Shaping a sphere into an apple
