

your texture to a height map (by converting it to greyscale in any image editing software). It may take quite some time fiddling around with the various values if this is the first time you are texturing. So, stick with it and try to get the best results.

Lighting

A very important part of the rendering process is lighting up your scene properly. The most common way to light up the scene is to use the 3-point lighting system.

3 Point Lighting System: In this lighting technique, as the name suggests, three light sources are used. The first light source is the key light. It is placed

Lighting setup

in front of the subject and provides major illumination for the scene. The second light source is the fill light, which provides secondary illumination and is placed opposite to the key light. The function of this light is to fill the extremely dark shadows with light. It is not as luminous as the key light. The third light source is the backlight. It is placed behind the subject to lightly highlight its edges and separate it from the background.

Another way to light up the scene is to mimic natural outdoor lighting. This can be achieved in various ways. One quick way to do this is by using a large Area light on top of the subject to mimic diffused lighting from the sky and a Sun lamp to mimic the sun. Use 'Shift+A' to add lights to the scene and edit their properties (change their type, size, strength and more) from
