

the Lamp tab on the right side of the screen. You can also tint them to help with the outdoor vibe.

Rendering

After all the effort, this is the final step to achieving your rendered image. Hit 'O' on Numpad to change to the camera view. Check if you need to make adjustments to the view. To make adjustments, you can use the transform tools on the camera to align it correctly towards the subject. A camera in Blender is very close, in its properties, to a real camera. While the camera is selected, go to the Camera tab on the right side of the screen. Here, you can

Your final render

configure the camera according to your artistic choice. You can even edit the depth of field and select the object to put the focus on. You can preview your render in the viewport by going to camera view and pressing 'Shift+Z'. You can also change the World Color under the World Tab. Before going for the final render, you can change certain render settings from the Render tab:

Aspect Ratio and Resolution: In Blender, aspect ratio and resolution of the final render can be changed independently. Make sure to drag the resolution slider to 100% before final render.

Exposure: If the scene looks underexposed/overexposed, you can change the exposure using the Exposure field in Film panel.

Samples: Samples relates to the number of calculations of light paths Blender makes to render your image. The higher the samples, the better the quality of the result. But increasing samples increases render times. So, it's crucial to maintain a balance between the two. Setting it to something around 256 should give you pretty neat results for this render. Make sure
