

The Blender Way

As the world moves on to incorporating more 3D content, the need for individuals skilled in the domain of 3D modelling software has shot through the roof. If you've ever paused and read through the credit roll at the end of a movie, you'll notice a lot of Indian names, especially in the CGI department. That's because a lot of the work done in mainstream movies, be it for a Hollywood blockbuster or a local sci-fi movie, is outsourced to Indian studios. And when it comes to 3D modelling software, there are always multiple camps that strongly favour a certain software solution. Some prefer proprietary ones such as Maya while others prefer open-source ones such as Blender. So why did we pick Blender?

Blender is a great choice for a lot of factors but it boils down to these two - it has a really powerful feature-set and it's free. Think of Blender as a stepping stone into the world of 3D modelling. Small studios start off with Blender since it's free before incorporating new pipelines for proprietary software later on as the studio matures. Several major studios build their own software layers in-house because even the likes of industry standards don't have the features that are necessary to get the job done. All that being said, nothing can match Blender in a popularity contest. As per current Google trends, Blender enjoys the top spot in search queries with 3ds Max in second spot and Autodesk Maya in third spot while Cinema 4D close on its heels. So when you learn Blender, you are increasing your prospects of
