

your system to go completely blank on you whilst you're sculpting those beautiful masterpieces. Keep in mind that in order of ascendancy, a single stick is obviously the worst in performance with a Dual-channel configuration being better and a quad channel edging out the Dual-channel. If you find that you need more RAM, it's as easy as adding more in the required slots on the motherboard. It's still in the works but the current test builds of Blender (2.8x) allow you to render using both your RAM and VRAM at the same time. Going by community feedback this has massively cut down the render times for many users. Hopefully we'll see it making its way to the stable builds later this year.

Storage

You don't necessarily need a mountain of storage space. Images, assets, and modelling files are significantly smaller than videos or games. A terabyte or two of hard disk drive space will do just fine.

SSDs

Get an SSD if you can. You'll know the difference instantly if you've been a longtime HDD user. The difference in read and write speeds is massive. Let's have a look at some benchmark tests to get some perspective: (The HDDs have been highlighted)

SSDs come out as the clear winner. The ramped up I/O operations with an SSD onboard will make everything feel a lot smoother and faster, from
