

Building the first bone in the rig.

ctrl+alt+shift+c and then click on “Origins to Geometry”. Now that we’re done with the alignment of the model we can begin with actual rigging.

Step 4: For humanoid rigging, it’s common practice always to move up the arms to the head and then again from the hips, move down to the feet. To centre the 3D cursor so we can spawn a rig wherever we want to, select the model, hover over the 3D viewport, hit shift+s and a menu will pop-up. Select “cursor to selection”, and the 3D cursor would move to the centre of the model that mostly lies somewhere in the hips.

Now, press shift+a to enter the spawn menu, and select “armature” and “single bone”. Apart from the translation arrows that come up on-screen, not much is visible yet. To correct this, go over to the

Extending the size of the bone.
