Animating 3-D objects in Blender

What are the various types of animation which exist?

When we are trying to create motion and movement of various existing still objects, there are a lot of different kinds of animation which manifest and thus a lot of options exist from which we can choose. The first kind of animation is Traditional Animation which is essentially hand-drawn 2-D animation. The next kind is Vector Based 2-D animation which is more advanced and nuanced.
