

Method 3: By using the hotkey 'T': On Buttons

This is the third way of setting a keyframe. In this, we are again using the “T” hotkey. However, this time, instead of using the keyframe animation directly onto the 3-D view, we are going to use it on buttons. This is because of the simple reason that almost any setting in Blender can be animated.

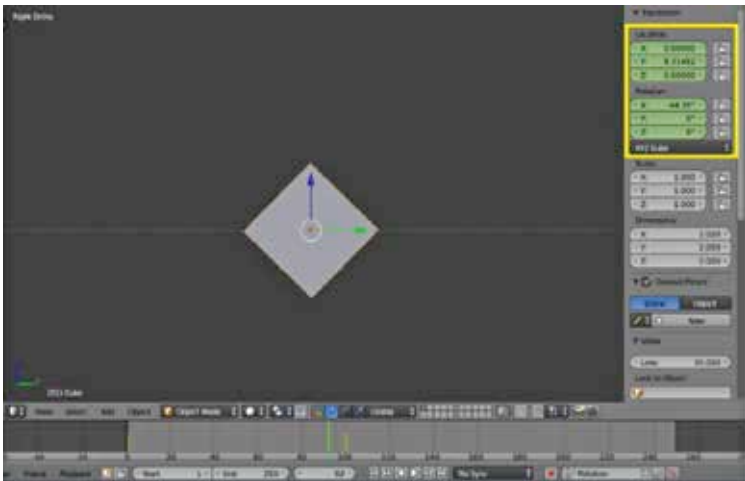

Rotating the keyframe

We now go to the properties toolbar and open it. This can be done by using the hotkey “N”. It is observed that the location and rotation transform properties are green in colour. The symbol green means that it is now animated by location as well as rotation. In some cases, we may notice that these symbols are a bright yellow-green. This implies that the current key has a keyframe on it.

Method 4: By using the hotkey 'T': On Buttons: Scaling

Now that we are done with animation by location and animation by rotation, the next stage in the cube's life is to animate the cube's scale with the scale properties.

Scaling rotation in keyframes
