

1. Make room for the mushroom.

The first step will be modelling. We create models which then go on to be animated. To put it into simpler terms, models correspond to real-world objects. You want to make these objects move or behave in a certain way which, you guessed it, is nothing but animation.

Fire up Blender and you will be greeted with a default scene that contains a cube, a camera and a lamp.

You will notice the three axes, X, Y and Z. X is colour-labelled red, Y blue and Z green. It is evident that your model is currently in a 3D space. There is a mini-axis located at the bottom-left of your view in case you lose track of your axes.

The default Blender workspace

To create your 3D objects, you'll need help from the four panes on the screen:

- Outliner – it lays down all the objects in your scene
- Properties – allows you to edit the properties of whatever object or material you're working with
- 3D view – it contains all the objects you're creating.
- Tool Shelf – shows relevant accessory options for the action you're currently performing in Blender.

Now that you're somewhat familiar with Blender UI let's get on with some basic concepts that'll come in handy in creating our first model.
