

Getting familiar with the animation timeline UI

Controlling the view

Getting familiar with the navigation controls would be our first step since we'll be using those a lot, and I mean a lot. The primary ways to control the view are:

- Rotation
- Zoom
- Panning up and down
- Panning right and left

The 3D scene can be depicted in two ways, orthogonal and perspective. Though both have their pros and cons, for this tutorial we will be mostly working with the orthogonal view.

The default view is set to Perspective so to change it select View > View Pers/Ortho from the toolbar under 3D view.

Manipulating Objects in Object Mode

Blender works in several different modes, and if you've been following the tutorial correctly, you should be in the Object mode (find it in the toolbar below the 3D view).

Selecting Objects

We need to get rid of the cube first to clear the space for our mushroom. Select the cube and press the right mouse button, press the X key and then choose Delete.
