

Download Blender

The Blender Foundation has three different options to distribute Blender. Each binary distribution has different advantages:

1. **Latest Stable Release** - It is thoroughly tested and is the best choice for production level models/animations. The newest features are not automatically updated.
2. **Daily Builds** - Blender is updated on a daily basis which include the latest changes and the newest features. They aren't very stable but are official releases.
3. **Build from Source** - It is the highly customisable binary mostly for developers. New features can be accessed as they are being developed. Any version or branch can be accessed.

We can download the binaries from <https://digit.in/BlenDL>

Install Blender

The installation procedure is same for all the binaries. The procedure is different for different operating systems.

- Installing on Windows: <https://digit.in/BlenWin>
- Installing on macOS: <https://digit.in/Blenmac>
- Installing on Linux: <https://digit.in/BlenLin>

User Interface

After installing Blender, getting around the basics is fairly simple. If we are familiar with other modelling software, embracing Blender will be effortless. And don't worry beginners, after this guide we'll know our way around Blender.

Opening

This is the first screen we see on opening Blender. It is called the Splash Screen. It contains help and all the recent projects.

- **Links**

It contains important links to the official documentation pages.

- **Recent**

It shows all the recently accessed files. A quick way to get right back into our projects.

- **Recover Last Session**

Based on temporary files, Blender will try to recreate our last session.
