

Using shortcut keys

Select the object. Press the appropriate key to begin the action and then to begin the transform move the mouse. For instance, to scale an object, select it, and then press the S key which is the shortcut key for scale and then move the mouse to control the scale accordingly. The further the mouse is moved, more is the translation.

Note that the shortcut keys to move is G, the scale is S and rotate is R.

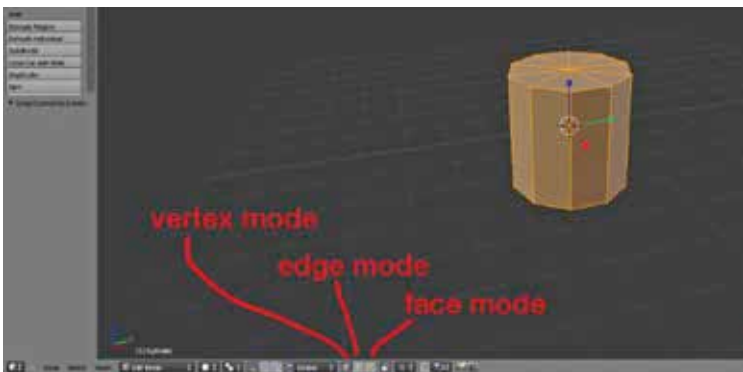

After you've done transforming the object, to retain the changes made click the left mouse button or if you aren't happy with the transform press the right mouse button to discard the changes and redo the whole thing again. And you've always had your good ol' Ctrl+Z at your disposal.

You can similarly transform using the handles and the properties panel.

Editing Objects in Object Mode

To begin editing the object first select it followed by Tab key.

The object will turn yellow with all the edges highlighted. The three little cubical icons in the bottom toolbar indicate the 'select' mode you're currently in vertex, edge or face mode.

Modes of editing objects

Presently you're in the vertex mode with everything in your object selected. You don't need this. Press the A key to deselect everything.

Loop cut and Slide

Presently, the object in our view looks nothing like a mushroom. Just a plain, old cylinder. We need to mould this into a mushroom and to do that we first need to add some segments.
