

Start with locating the Loop Cut and Slide which is on the left-hand side of the screen.

Hover your mouse over your object, and you'll notice a purple edge-ring right at the level of the cylinder's vertical centre. Perform a single-left click; the vertices turn to yellow from purple which means that all the vertices of the object have been selected and are movable.

Transforming Edges, Vertices and Faces

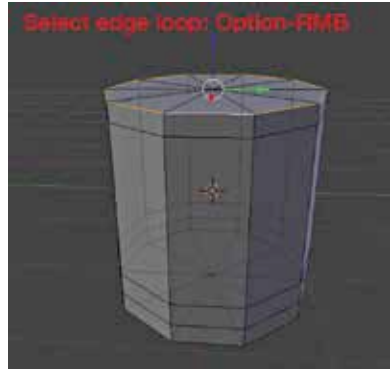

Again, this can be done using either transform handles or the shortcut keys or the properties panel.

First select the edges using the Box, Circle or Lasso select. The bottom toolbar has an arrow icon next to the axes icon. This is the Translate manipulator. Click the manipulator.

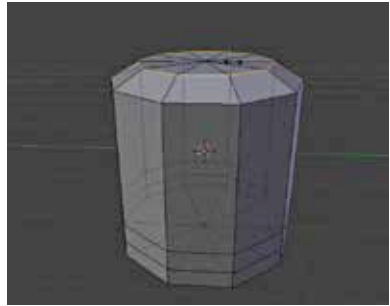

It's time to start tinkering with our object. We'll start with the edges and faces to create the top of our mushroom. Press the Alt key followed by a right mouse click on any one of the top edges of the cylinder. This selects the entire loop.

To scale the edges, press S and then drag the mouse to make the edge loop smaller.

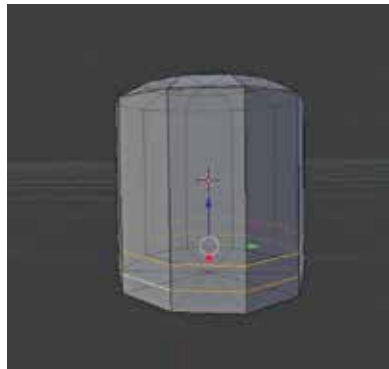

If you're satisfied with the scaling, press the left mouse button to confirm the transform.

Begin the transform

Mushroom curvature achieved
