

What we need to do now is make the top of the mushroom in a hat-like fashion, i.e. the bottom edge of the top of the mushroom should be larger than the top. Select the two inner edge loops near the bottom of the cylinder. Now again scale accordingly.

Play around a little more with loops and perfect the top so that the final result looks like what's showcased in the images.

Mushroom head nearly achieved

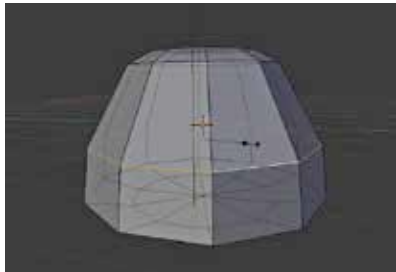

Extrude Transform

Moving on to the next part, the Stalk. This will be done using extrude.

Adjust the view so as that bottom of the mushroom head is visible. To avoid the stalk from taking the radius of the base as its own, you need to scale the bottom edge. Scale the bottom to about one-half the original size.

Now switch to face select using the icon. Hold down Ctrl and right-click on every one of the bottom faces:

On the left-hand tool panel, select the Extrude Region option. You'll see that as soon as you click the option, the faces start extruding on mouse action. Now extrude the face to an appropriate length for the mushroom stem.

Repeat till desired curvature is met

Getting started with the stalk

Make other adjustments as you wish to perfect your mushroom using the techniques discussed above.

Don't forget to save your model constantly; you never know.
