

1. **Tensorflow:** It is a symbolic open-source software library for dataflow programming across a range of tasks like machine learning. It is backed by Google and is the most popular deep learning and numerical computation framework in the recent times.
- 
2. **PyTorch:** It is an open source machine learning library for Python developed by Facebook's AI research group. It is widely used for applications such as natural language processing.
  3. **Theano:** Theano was developed in 2007 at the University of Montreal and is the oldest significant Python deep learning framework. It is an optimising compiler used for evaluating and manipulating mathematical expressions.
  4. **Caffe:** Caffe is an open sourced deep learning framework developed around five years ago at University of California, Berkeley. It is used mainly for academic purposes.
  5. **Microsoft CNTK:** Microsoft Cognitive Toolkit is a deep learning framework developed by Microsoft Research. It describes neural networks via directed graphs and is written in C++.
  6. **Apache MXNet:** Apache MXNet is an open-source scalable deep learning software framework used for deep learning applications. It is used by Amazon and supports a flexible programming model with multiple programming languages like C, C++, Python, R among others.

### Comparison of Keras with other deep learning frameworks:

Keras, TensorFlow and Pytorch are among the top frameworks preferred by Data Scientists as well as beginners in the field of Deep Learning. We compare them based on various parameters such as Level of API, Speed, Architecture, Debugging, Dataset, access to learning resources, cross platform portability and popularity.

1. **Level of Application Program Interface (API):** Keras is a high-level API capable of running on top of various numerical computation libraries
