

1. **Online Job Listings:** Tensorflow is the most preferred deep learning framework in the market according to job listings on Simply Hired, LinkedIn, Monster, Indeed, and Angel List. In most of the job listings, Keras is at the second position.
2. **Usage:** Data science website KDnuggets polled data scientists around the world on the deep learning framework that they used. Tensorflow came out on top with Keras following very closely.
3. **Activity on GitHub:** Another indicator of framework popularity is activity on GitHub. Analysing the stars, watchers, forks, and contributors on GitHub separately revealed the following statistics – Tensorflow is the most popular framework followed by a tough fight between Keras, Caffe and PyTorch.

4. **Publications:** Various publication on Medium (a place for popular data science articles and guides), Amazon Books and on ArXiv (an online repository where most scholarly machine learning articles are published) reveal interesting trends. According to Medium, many more Keras articles were published in comparison to Tensorflow. However, both Amazon Books and ArXiv had more articles and papers related to Tensorflow framework than Keras.
5. **Google Search Activity:** A good gauge of popularity is analysing the web searches on the largest search engine. Search history results using Google Trends reveals that Keras was not far from TensorFlow (September 2018). PyTorch was the third most searched framework and other frameworks had relatively low search volume.
