

The popularity analysis using various evaluation criterion found that although Tensorflow is the most popular deep learning framework on various parameters, Keras is not far behind and is catching up fast. The above graph validates this fact. It is ideally suited for beginners in the vast field of deep learning. It has some clear advantages over other deep learning frameworks such as being user friendly, high level of abstraction, great cross platform portability, a high level of architecture along with a vast pool of resources to learn. Keras is without doubt the best option if you want a plug & play framework. It is the best choice if you want to quickly build, train, and evaluate a model, without spending much time on complexities of the mathematical implementation details. [d](#)
