

Sequential Models

The simplest way to use Keras

A model is the initial building block of Keras. There are two types of models in Keras – Sequential models and models with Functional API. A sequential model is the simplest model of Keras. It is a linear pipeline or a stack of various types of neural network layers. It can be used to develop various kinds of models like Multilayer Perceptron (MLP) for multi-class softmax classification and binary classification, Convolutional Neural Networks using various architectures such as VGG, Sequential classification models with Long Short Term Memory (LSTM), and even stacked LSTM models that are rendered stateful. Working with all these models is quite easy using Sequential models of Keras because references to all of them are available in the official documentation of Keras Sequential Models.
