

Training and Validation

Training is the time consuming process through which the machine learns to perform a task.

In every machine learning tutorial one encounters the terms ‘training’ set, ‘testing’ set and ‘validation’ set. Distinguishing between them as a beginner can be quite troubling. So, let’s go by the book and start from the beginning.

What are ‘training’, ‘testing’ and ‘validation’ datasets?

Before we dive deep into the subject, here is a quick overview:

- **Training dataset** is the sample data used to build the model. This is the data which the model uses to learn (update weights).
