Let's build a simple image classifier using Kereas to distinguish between two classes of objects

At the dawn of the fourth industrial revolution of Artificial Intelligence, robotics and machine learning, the time has certainly come for the machines to perform tasks that were previously characteristic of human intelligence only. Machines can use their intelligence to do things like pattern recognising, understanding natural language, learning and solving problems and even generating music. Image recognition and classification is certainly one of highly valued intelligence. It has applications in various fields ranging from automated self-driving cars, scaling augmented reality applications and gaming, Face Recognition on Social Networks and various security systems. It has been a boon for the medical science
