

Figure : Flattening layer example

learnings on new data. An over fitted model will perform excellently at training time but fail at test time.

- 3. Following the max pool layer, we add a Flatten layer. A conv2D layers extract and learn spatial features that are passed to a dense layer after it has been flattened. The work of the flatten layer is to convert the matrix returned by the max pool layer into a linear array.
- 4. After the flatten layer, we add a Dropout layer. Dropout randomly drops

Figure : Summary of our model
