

discusses complex concepts such as Generative Adversarial Networks, Autoencoders and Recursive Neural Tensor Networks (RNTNs) among many others.

Third party Python Libraries:

The following segment contains a list of open source Python libraries that are helpful in performing complex tasks such as scaling distributed deep learning models, hyper parameter optimization, etc. and contains various toolkits such as language modelling toolkit in Keras.

1. <https://github.com/maxpumperla/elephas>: The Elephas library is an extension of Keras that allows you to run distributed deep learning models at scale with Spark. It supports a wide variety of tasks such as Data-parallel training of deep learning models, distributed training of ensemble models and distributed hyper parameter optimization.
2. <https://github.com/maxpumperla/hyperas>: Hyperas is a very simple convenience wrapper library around hyperopt for fast prototyping with Keras models. It is used for hyper parameter optimization.
3. <https://github.com/farizrahman4u/qlearning4k>: Qlearning4k is a reinforcement learning add-on for the python using Keras. It is user friendly and is ideal for rapid prototyping.
4. <https://github.com/farizrahman4u/seq2seq>: Seq2Seq is a sequence-to-sequence learning library add on for python using Keras. It enables you to build and train sequence-to-sequence neural network models in Keras that are useful for machine translation and chat bots.
5. <https://github.com/codekansas/keras-language-modeling>: Keras Language modelling is a toolkit for doing language modelling with Keras, particularly for question-answering tasks.
6. <https://github.com/farizrahman4u/recurrentshop>: Recurrent Shop is a python framework for building complex recurrent neural networks with Keras. Its key feature is that it deploys reusable Recurrent Neural Network cells.
7. <https://github.com/ragbakot/keras-vis>: Keras-vis is a high-level toolkit for visualizing and debugging trained Keras neural network models. It supports visualizations such as Activation maximization, Saliency maps and Class activation maps.

Projects

The following list contains some well-designed open sourced projects in deep learning that have been developed using the Keras framework in
