

Python. They span a variety of domains ranging from jazz music generation to neural machine translation – all using Keras!

1. <https://github.com/Rochester-NRT/RocAlphaGo>: This project is a student-led reference implementation of DeepMind's 2016 Nature publication, "Mastering the game of Go with deep neural networks and tree search". Although, it is not fully implemented till now, it still gives various insights and also a platform to contribute.
2. <https://github.com/jisungk/deepjazz>: Deep Jazz uses two deep learning libraries – Keras and Theano to generate jazz music. It works by building a two-layer LSTM and learning from the given MIDI file.
3. <https://github.com/udibr/headlines>: This project reproduces the results in the paper: Generating News Headlines with Recurrent Neural Networks. It automatically generate headlines to short articles.
4. <https://github.com/lvapeab/nmt-keras>: This project is an implementation of Attentional recurrent neural network NMT model that is widely used for neural machine translation using Keras.
5. [https://github.com/anuragmisbracse/caption\\_generator](https://github.com/anuragmisbracse/caption_generator): This project is to caption images using Keras. It has three parts - An encoder Convolutional Neural Network model, a word-embedding model and finally a decoder Recurrent Neural Network model.

This list is not an exhaustive one because tremendous research is going on how to use deep learning with Keras in various domains. Yet, it covers majority of the open source code and quality tutorials that are ideal for beginners as well as professionals. It throws light on all the applications of deep learning using Keras framework in various fields – computer vision, natural language processing, and reinforcement learning among many others. It also contains Keras implementation of some of the recently published research papers.
