

9. Now revert to the browser and refresh the page. The login page is displayed.
10. Enter the default credentials, i.e. “admin/password”, and log into the application.

With this step, we have successfully configured a web server and hosted an application on the same. Now, we can access this application from Kali Linux or BackTrack using the <http://ip-address-of-windows-xp-machine/dvwa/login.php> URL and practice the attacks.

Part 3: Setting up Kali Linux

Why Kali Linux?

Kali Linux is an open-source, Debian-based operating system which comes pre-loaded with a wide variety of penetration testing tools and security-oriented utilities. It is highly customizable and comes with a custom kernel, patched for injections. If you haven't got a fair bit of experience working with Linux, then Kali Linux would be a good first OS for you.

Now same as that of Windows, download the Kali Linux virtual image. After you finish downloading, follow with the steps below:

1. Launch VMware workstation
2. Open the Kali Linux image by going to File > Open
3. Click the “Edit virtual machine settings” button to configure the other settings:
 - Memory: Allocate the necessary amount of RAM to your virtual machine. Any amount above 2 GB is preferred.
