

data between the operating system and the devices attached like a mouse, printer, keyboard etc.

A BIOS password is one of the most basic ways of securing a PC. It is the information required to log into a computer's BIOS before it starts to boot up.

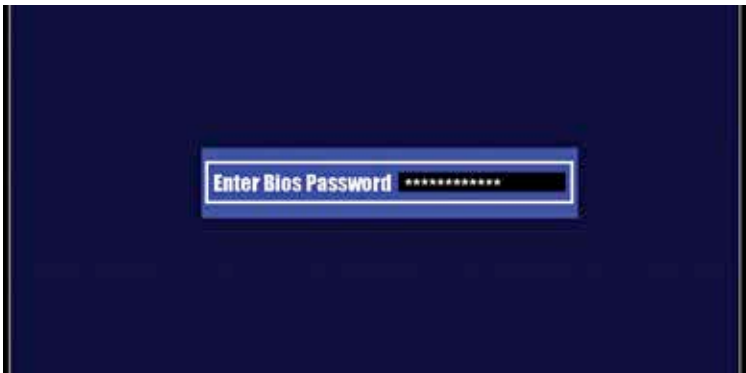

Below are some of the ways

To hack a BIOS password protected PC by removing the CMOS battery:

CMOS or complementary metal oxide semiconductor is present on the motherboard. BIOS password can be bypassed by removing the CMOS battery and putting it back after waiting for 10-15 minutes.

By running a command from MS-Dos prompt: If access to the installed operating system is allowed, then it is possible to reset the BIOS password by the executing the following code in the same order on MS-Dos:

```
debug
- o 70 2E
- o 71 FF
quit
```

By using third party software: Similar to the last step if access to the installed operating system is allowed then the BIOS password can be reset by using many third party softwares like CmosPwd, Kioskea etc.

By finding the backdoor BIOS password: Backdoor passwords are master passwords which are provided by the BIOS manufacturers. A backdoor password will work even if there is a manually set BIOS password. Some backdoor passwords of famous manufacturers are:

- Siemens – SKY_FOX
