

Password cracking softwares

There are various software programs that can be used to hack passwords. Some of them are listed on the next page:

- John the Ripper – It used commands to crack passwords.
- Cain and Abel – It worked only on Windows and used a dictionary attack to crack passwords.
- OphCrack – It is the most popular rainbow table-based password cracking tools which work on Windows as well as Linux and Mac.
- LOphCrack – It is same as OphCrack and cracks windows passwords from hashes.

Bypassing anti-virus software

We use anti-virus software to prevent or detect any harmful software or virus and protect our system from getting attacked. Even though they are made to keep a computer safe, bypassing them isn't too difficult.

Veil-evasion is a tool used to generate payloads which are undetectable to antiviruses, and can be used to bypass common anti-virus solutions.

How to use veil

To install veil, open a terminal and run –

```
Apt-get-y install git clone https://github.com/Veil-Framework/
Veil-Evasion.git
cd Veil-Evasion/
cd setup
Setup.sh-c
```

After installing, open terminal and navigate to veil framework directory.

Then look for available payloads in a veil using the list command.

Select a payload among the available default payload.

Set phyrion encryptor to yes “SET USE_PHYRION Y” using the SET command.

Type generate the payload and use msfvenom by default and use the default handle.

Fill the values for LHOST and LPORT.

After the payload is successfully generated, the payload generated location and handler file for msg will be shown. Type:

```
#msfconsole -r/usr/share/veil-output/handlers/payload_handler.rc
```

Move the payload to execute on any anti-virus of choice.
