

Exploiting vulnerabilities in Windows 10

If you think Windows 10 is safe from hacking, think again. Some of the vulnerabilities of Windows 10 include:

Win32k Elevation of Privilege Vulnerability(CVE-2015-0057)

It's a GUI component flaw which can allow a hacker to gain complete control of a Windows machine through privilege escalation.

Microsoft Font Driver Vulnerability(MS15-078)

Windows Adobe Type Manager is inefficient in handling Open type fonts. This can allow a hacker to install programs, manipulate data and create new accounts.

Microsoft Windows Journal Vulnerability(MS15-098)

This can allow the hacker to remote execute codes if users open a specially crafted journal file.

Windows 10 WiFi vulnerability

Windows 10 shares WiFi credentials with Facebook, Skype and Outlook contacts to make WiFi and hotspot sharing better. But this can allow any of these contacts to use the WiFi network without any authorisation.

Internet Explorer Vulnerabilities(MS15-079)

This can allow hackers to gain system rights of the user.

Microsoft graphics component vulnerabilities

This arises from font and memory management flaws, which can give access to the hacker to remotely executes codes if opening an untrusted website with embedded fonts.

Poor file and share permissions

This vulnerability can give a hacker access to all the files in the system.

Re-Direct to SMB Vulnerability(CVE-2015-5143)

This mainly involves a core Windows API library and how Windows connects to SMB. This can redirect users to harmful SMB based servers and losing their encrypted login credentials.
