

Hacking a Wi-Fi Network

What is hacking?

Unauthorized intrusion into a computer or a network is called hacking. A hacker is a person who engages in these activities. This hacker usually changes systems or security features to perform a task that differs from the original intent of the system.

Non-malicious activities, usually involving improvised changes to processes, are also categorized under hacking.

A variety of techniques are used for hacking, including:

- **Vulnerability scanner:** checks for vulnerabilities on computers or networks
- **Password cracking:** as the name suggests, the process of hacking passwords from computer systems or networks
- **Packet sniffer:** captures data packets to look for passwords and other data being transmitted
