

- **Spoofing attack:** mimicking websites to obtain data from users or programs which trust it as a legitimate site.
- **Trojan horse:** mimics the famous ancient strategy of the trojan horse to create backdoor access to the computer
- **Viruses:** self-replicating programs that spread by inserting copies of themselves into executable code or the network
- **Key loggers:** recording user keystrokes and retrieving them later to gain access to passwords, data and other personal information

Hackers are an important part of many corporations. These hackers use their skills to find flaws in the company security system, thus preventing computer-related crimes.

This article is focused on hacking a Wi-Fi network using a variety of generic tools using a Linux based Operating System. Before we begin, it is to be noted that hacking is only legal when the network belongs to you or belongs to someone who has permitted you to hack the network. Hacking networks that don't meet this criterion is strictly illegal and may constitute a serious criminal offence in most parts of the world. Stay informed and stay safe.

How to begin

To begin, we need a basic knowledge of what we are about to hack and the necessary tools for it. After this walkthrough, we would be ready for the real deal.
