

Tools Used

The most convenient OS to hack with is Kali Linux. It's a Linux based OS and was specially built for penetration testing purposes. You can download the official version from their website: <https://www.kali.org/downloads>.

Once done with the installation, we need a couple of other basic requirements like a wireless adapter (you're fine if you already connect to the internet using Wi-Fi), a Wi-Fi network to crack (preferably your network to avoid legal issues) and few other software.

Aircrack-ng, Wireshark and Reaver are a must to have for hacking a network. Reaver usually comes with Kali Linux. Other software is also discussed in the section below. Download Wireshark as follows :

Before installation, meet the dependencies:

- `$ sudo apt-get install build-essential checkinstall lib-curl4-openssl-dev bison flex qt5-default qttools5-dev libssl-dev libgtk-3-dev libpcap-d`

Once all the dependencies are installed, run the following in the terminal.

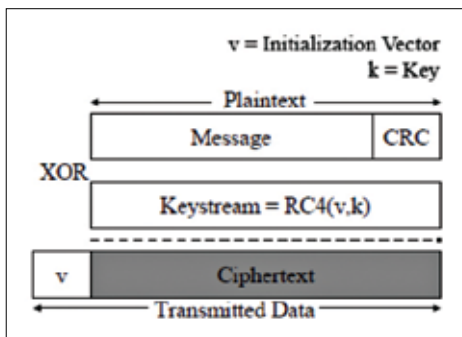

- `$ sudo add-apt-repository ppa:wireshark-dev/stable`
- `$ sudo apt-get update`
- `$ sudo apt-get install wireshark`

How to Hack

Now that basic of all the networks are covered let's get to hacking these networks.

WEP

Most of the attacks rely on inherent weaknesses in initialization vectors. You will get the password if you collect enough of them. Here is a step-by-step guide to hack into a WEP network.

- Find out the name of your wireless adapter.

Computer has many network adapters. To scan one, you need to know the name of the adapter. There are three types of adapters:

- `lo` - loopback
