BeEF?

BeEF (The Browser Exploitation Framework) is a penetration-testing tool which focuses on the web browser. BeEF is a framework for launching cyber-attacks, just like Metasploit. However, unlike Metasploit, it is specifically used for launching attacks against web browsers. It can also be used for operating system attacks. BeEF is also used in conjunction with Metasploit to launch specific attacks.

BeEF is built on the Ruby on Rails platform. Initially, its purpose was to explore and test vulnerabilities in browsers. It is an excellent platform for testing a web browser's vulnerability to cross-site scripting (XSS) and various other types of injection attacks.
