

Using commands to get cookies in browsers

from multiple scattered resources on the internet. It is used to determine the relationship between people – their Email addresses, names and aliases; between groups of people on social networks; companies; organizations; web sites and internet infrastructure like domains, DNS names, IP addresses, Netblocks; affiliations and documents and files.

Maltego uses transforms for automating the process of querying different data sources. Information obtained through transformation is displayed on a node-based graph that is suited for performing link analysis. This enables the results to be displayed in a huge range of layouts that allows clustering of Information. It helps in displaying the relationships between various entities in immediately and accurately – even making it possible to see hidden connections, although they may be three to four degrees of separation apart. There are three versions of the Maltego client - Maltego CE (Community Edition), Maltego XL and Maltego Classic.

How does Maltego gather Information?

Maltego is an Open Source Intelligence Technique (OSINT) investigation tool that pulls in related Information related to the query via API pulls and then compares the retrieved data to look for meaningful relationships between them. In this way, relationships between various data elements that might not immediately be obvious are presented in a clear and understandable way. Maltego can also be used for data augmentation by starting at a single point of Information and then it expands to include more data by running a variety of different transforms. Transforms are used by Maltego to find and display relationships between
