

Step 2. Install the “HavelBeenPwned” Transform

To utilize the full power of Maltego, we need to install free and paid transforms to enrich the retrieved data from the main transform hub page. For spoofing emails, install the “havebeenpwned” transform. It is present at the lower-right corner of the screen, as shown in the figure below.

Installing the HavelBeenPwned transform

Step 3. Creating a New Graph

After the “haveibeenpwned” transform is installed, we need to create a new graph to start our investigation of the data. To create a blank canvas, click on the document icon that has the green plus on it at the top-left corner of Maltego.

Step 4: Search for Email Addresses from a target Organization

Our next step is to scrape email addresses from an organization. To do this, use the “Company Stalker” machine that provides a convenient way to scrape a large amount of data simultaneously. It can also be done by adding the company domain to the blank canvas. Open Source Intelligence Analysis of individuals and corporations can also be done using Maltego Facial recognition. Selecting any of the icons at the left entity palate and by dragging and dropping, onto the main graph will add an entity to our blank canvas. To add Information or access the properties of an added entity, double click on it.
