

Using Company Stalker Machine

Using “Company Stalker”: The “Company Stalker” takes a single domain and attempts to collect all the Information that is relevant from that domain, along with the email addresses of the individuals associated with that organization.

1. Start a Company Stalker machine by clicking on the “Machines” tab at the top of the Maltego window. Then click on the “Run Machine” icon. Now select the “Company Stalker” Machine.
2. After selecting the machine, enter the domain name of the organization that you wish to find email addresses and other Information from. Like in the example given below, we use the domain name of SpaceX.com. Since this organization has a relatively large database of employees.
3. After selecting the domain name, the data related to the company that is a mixture of found documents, email addresses and other related data appear on the graph. Our next step is to enrich the data and increase our sample space.

Step 5: Enriching Retrieved Information

Now we need to examine the retrieved data and delete the entities that are irrelevant to our task. To delete the irrelevant entities sort them on the Detail View window by the entity type parameter, select the irrelevant types, and finally right click on the selected group for the “Delete” option that is a red “X.”
