

which you can clone the code to perform the tests. Droopescan performs four main types of tests -

- Plugins installed in the target host system
- Themes installed
- Versions
- Interesting URLs (admin panels, readme files and so on)

The output from Droopescan will be something similar to the image on the next page.

e. Check for Plugin Threats

The best thing about WordPress is the flexibility it offers with the number of available plugins. You will find a plug-in for almost anything, which saves you time from writing custom code. However, a recent survey report from Wordfence indicates that about 56% of the websites get hacked as a result of these plugins being vulnerable to an attack. Therefore, it's important for businesses to choose the right plug-ins for their CMS.

Websites such as the WPScan Vulnerability Database help ethical hackers to search for the plugin and see if it appears in the list of vulnerable plugins. Even web developers can access these websites as a precautionary measure when developing the website to ensure the safety of the website.

If businesses are using WordPress, plug-ins like Wordfence Security can also be added to the WordPress dashboard. This plugin will run a daily scan on the website and notify if any vulnerabilities are found.

Multiple CMS installations on a single server

Building a website for your business is one aspect while maintaining it is
