

the more crucial aspect. Your website can be built on a CMS that is either running on a local on-premise server or the server of the hosting provider (for example, GoDaddy, Bluehost, SiteGround, and so on). In either case, it's the responsibility of the business or the individual owning the website to safeguard and secure the server from attacks.

When using WordPress CMS, most companies take advantage of a third-party hosting service offered by service providers. However, businesses need to be very clear about choosing between a Shared Hosting and a Managed Hosting. In this section, let's try to understand the difference between Shared and Managed Hosting and the risks involved with Shared Hosting.

Shared Hosting

Given the costs involved in setting up a website (developing the website, hosting the website, managing the domain, etc.,) is very expensive, most businesses and individual website owners prefer to host their website on a shared web hosting platform. With WordPress, when you opt for shared hosting, it's important to remember that multiple customer sites will be running on the same WordPress server.

Managed Hosting

With managed hosting, you get a dedicated WP server for your website. It's obvious that this option will be expensive than shared hosting since it's the entire responsibility of the provider to take care of the infrastructure, security and the services that are offered as a part of the hosting plan. The benefits of managed hosting are high levels of
