

Let's take the same example of GNU website and enter the IP address in Bing search to see the list of domain names under the server.

d. Google Dorking

Google Dorking, also known as Google Hacking, is a technique that can be used by ethical hackers to find security loopholes in the website configurations and code. This technique makes use of Google Search and other related Google applications to help hackers find these loopholes.

Google Hacking is a search string that uses advanced search operators to find information that is not readily available on a website. The retrieved information will be the ones that are not protected within the website. This is a way of a passive attack that hackers can use to retrieve sensitive information like name, password, email lists, and so on.

For instance, using the below script on Microsoft FrontPage server can help hackers retrieve usernames and password from the server.

```
"# -FrontPage-" ext:pwd inurl:(service | authors | administrators | users) "# -FrontPage-" inurl:service.pwd
```

Another most used search operator is the intitle: index.of(keyword) that can retrieve the list of all the files on the servers.
