

Ethical Hacking

Every month a new data breach makes the front-page of the newspapers. The year 2018 alone saw five major institutions with 100m+ consumer accounts compromised in their respective breaches taking the total count of the year to the vicinity of a billion affected accounts!

Although Hollywood has done its best to perpetuate the stereotypical image of a notorious hacker, sitting behind his computer screen, his hoodie on, staring at green text and mysterious dialog-boxes filling up his entire screen-space... that's not accurate, obviously. The reality is pretty different from this theatrical and misleading depiction of a 'hacker'. Similar to the real world, there are good 'hackers', and there are 'bad' hackers, and there are hackers who don't fall in either of the two categories.

Every hacker is driven by their own set of personal goals and objectives. Hackers are generally differentiated by their agenda, methodologies and skill practice. Common practice puts hackers in three broad categories based on their agenda: white hat hackers or ethical hackers,
