

Why you must get it:

The main reason to LightZone is because it seems like a complete package. It has features like converting RAW images, and a wide array of commonly-used image editing tools. Though it is an open source project, it become a commercial tools these days with its comprehensive and detailed help files structure which is not even provided by the popular photo editing softwares.

03

digiKam

Brief Description:

digiKam is an advanced and powerful photo manager which is mainly used for organizing and editing software, developed for Linux users, however, later it got adapted to Windows and Mac operating systems too. This digital photo management application is built for KDE which helps import and organise digital photos in no time. The digiKam software is a comprehensive package which allows you to import images from various sources, organize them into

albums, and use it later for any purpose. The organized folder lets us search or browse through our collection based on location, time, tags, faces, and more. It lets the user retouch photos in a full strength editor using both basic and advanced editing tools. It doesn't pose restrictions on the user to export only to a selective place as the edited images can be shared via online hosts.

Why you must get it:

The major feature which distinguishes digiKam from other photo editing apps is its depth searching feature. Multiple users can't keep track of what name
